Latin Modern fonts: what are they?

A collection of fonts (currently 69)
in the POSTSCRIPT Type 1 and OTF formats,
based on the Computer Modern fonts, equipped
with a rich repertoire of diacritical characters

Availability—CTAN, for example:
<ftp://ftp.dante.de/tex-archives/fonts/lm>

current version: 0.99.3
number of glyphs: 46 849 (ca 680 per font)
licence: openware, LPPL-based
maintainers: B. Jackowski and J. M. Nowacki, GUST

Latin Modern fonts: what are they for?

The Latin Modern project, launched by local T_EX users groups in Spring 2002, aimed at the collection of multilingual Latin-based fonts that could be used as a *default* font family in the realm of T_EX.

Moreover, being distributed in both POSTSCRIPT Type 1 and OTF formats, the Latin Modern fonts can be used in any system that supports these formats.

Why Latin Modern fonts?

Other possibilities:

- Computer Modern fonts (D. E. Knuth, 1982)
obsolete because of the lack of diacritical characters
- EC fonts (J. Knappen and N. Schwartz, 1997)
obsolete because of the lack of outline fonts
- CM-Super family (V. Volovich, 2002)
very large and difficult to maintain

The Latin Modern distribution

- POSTSCRIPT Type 1 fonts, produced by METATYPE1 (METAPOST engine plus a bunch of AWK scripts)
- OpenType fonts, prepared using Adobe Font Development Kit for OpenType (implemented features: liga, onum, csp, dlig, frac)
- Support for T_EX (*.tfm files)
- Support for dvips and pdfT_EX (*.map and *.enc files)
- Support for L_AT_EX (*.fd and *.sty files)
- Substitutions (partial, of course) for CM, PL, CS, VN; the idea: to use the original TFM files with the relevant Latin Modern PFB files and dvips requisites
- METATYPE1 sources

The Latin Modern distribution: encodings

The LM package provides T_EX font metric files for:

- EC (Cork) encoding (ec-*.tfm)
- EL (European Letters aka dense) encoding, el-*.tfm (originally introduced by the ConT_EXt fraternity)
- QX (GUST) encoding, qx-*.tfm
- Y&Y's T_EX'n'ANSI aka LY1 encoding, texnansi-*.tfm
- T5 (Vietnamese) encoding, t5-*.tfm
- Text Companion for EC fonts aka TS1, ts1-*.tfm

Who is to be blamed for the plentitude of diacritical characters?

Six hundred years ago people tried to avoid them:

*Ztyechto kussow myey nauczenye kterak mass zyw
byty aswey dussy prospyety /
Prwy kuss zlaty / ktoz da geden halerz*

Z těchto kusův měj naučení, kterak máš živ
býti a své duši prospěti.

Prvý kus zlatý: Ktož dá jeden haléř...

Jan Hus (1371–1415), *Devět zlatých kusů*

What can be found in the Internet about haček?

- It was introduced by Jan Hus (probably)
- HACEK can be acute to your heart...

The acronym HACEK refers to a grouping of gram-negative bacilli:

Haemophilus species,
Actinobacillus actinomycetemcomitans,
Cardiobacterium hominis,
Eikenella corrodens,
Kingella species.

These organisms are responsible for *acute* heart diseases.

What can be found in the Internet about haček?

- It was introduced by Jan Hus (probably)
- HACEK can be acute to your heart...
- Which, in a way, agrees with D. E. Knuth's anticipation:

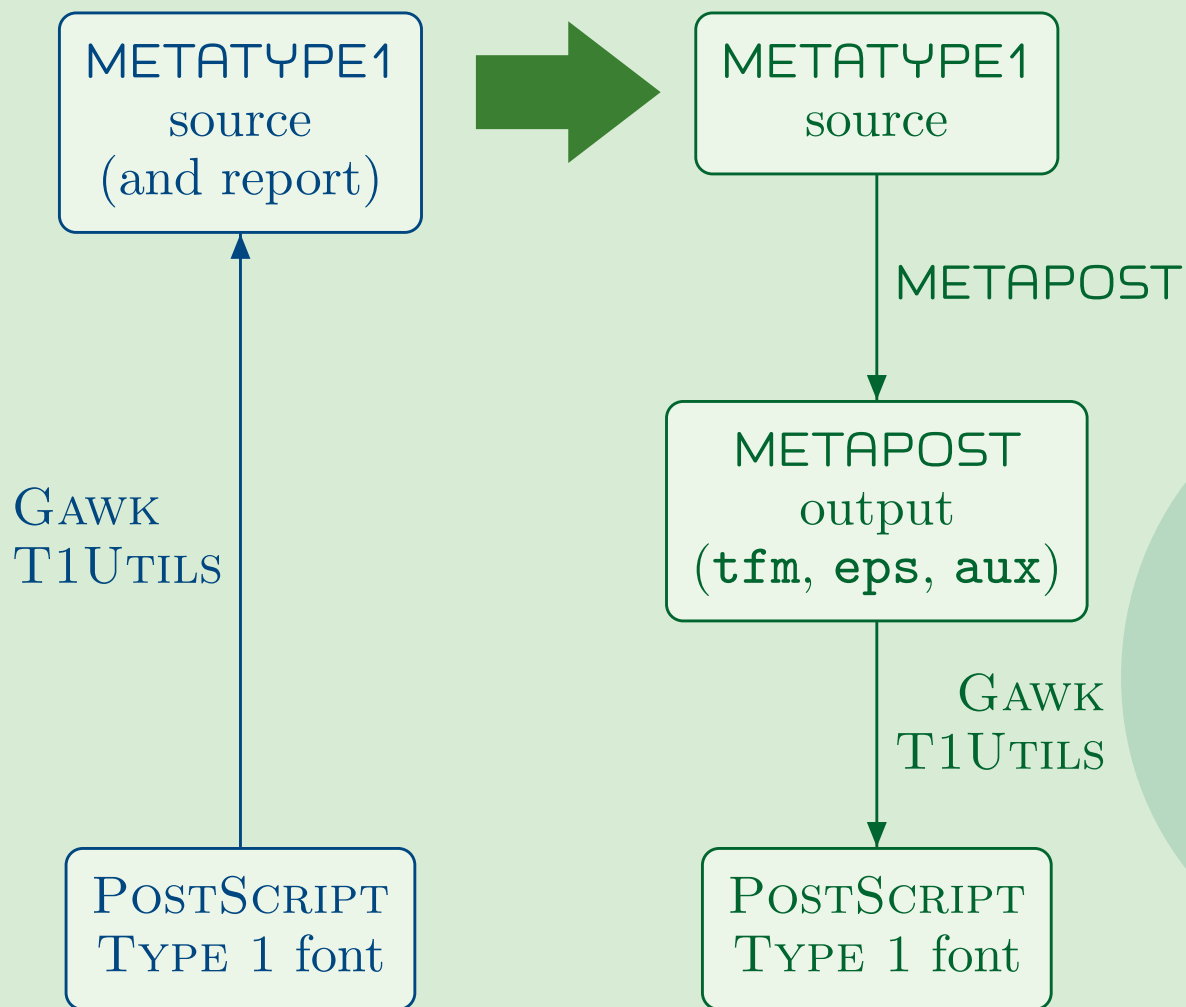

Type design can be hazardous [...] Once you get hooked, you will develop intense feelings about letterforms; the medium will intrude on the messages that you read. And you will perpetually be thinking of improvements to the fonts that you see everywhere, especially those of your own design.

Isn't it a heart disease?

Compatibility issues

- A subset of CM's font metric files can be safely used with LM's PFB files; known exceptions:
 - lack of math (will be fixed soon)
 - a macro `\hbar` produces slightly worse result (green – **CM**, gray – **LM**, blue – **LM** glyph):

h h h

Compatibility issues

- A subset of CM's font metric files can be safely used with LM's PFB files; known exceptions:
 - lack of math (will be fixed soon)
 - a macro `\hbar` produces slightly worse result
 - there are some discrepancies between CS and LM Type 1 (PFB) fonts, reported by Karel Píška; for example, the widths of guillemots differ, most significantly in 5-point fonts:
 `csr5.pfb`: $5000/9 = 555.556$; `lmr5.pfb`: 750
 but in `csr10.pfb` i and `lmr10.pfb` the respective widths are consistent:
 `csr10.pfb`: $5000/9 = 555.556$
 `lmr10.pfb`: $5000/9 = 555.556$

Compatibility issues

- A subset of CM's font metric files can be safely used with LM's PFB files
- In general, however, full compatibility cannot be even dreamt of
 - the sets of fonts differ
 - the exact dimensions of glyphs cannot be retained (the infamous limit of 16 heights, 16 depths and 64 italic corrections)
 - in the LM fonts some apparent flaws of the CM fonts have been corrected (both concerning metric data and character shapes)

Compatibility issues

What can we do to make the LM fonts usable for the Czech T_EX community?

- We have already equipped LMs in Czech double quotes
- Accents (haček) have been modified
- CS encoding(s), i.e., the relevant *.tfm files, can be easily added to the LM distribution
- We are open to further suggestions

Compatibility issues: an example of strange kernings that have been corrected

The file `roman.mf` reads:

```
% three degrees of kerning:  
k#:=-.5u#; kk#:=-1.5u#; kkk#:=-2u#;  
ligtable "k":  
  if serifs: "v": "a" kern -u#, fi  
  "w": "e" kern k#, "a" kern k#,  
        "o" kern k#, "c" kern k#;
```

The kern pair **k-a** appears in TFMs of serif fonts twice: first with the value $-u\#$, next with the value $k\#$, i.e., $-0.5u\#$; moreover, there are no **v-a**, **v-c**, **v-e**, and **v-o** kern pairs in sansserif fonts, although there are **k-c**, **k-a**, **k-e**, **k-o**, **w-a**, **w-c**, **w-e**, and **w-o** kern pairs in these fonts.

The problem of missing **v-*** kerns in sansserif variants occurs in EC, CS, PL, VN, and CM-Super fonts!

- We are not going to increase the number of so called *optical sizes*—can you see any difference?

A lowercase letter 'e' from the Latin Modern font family, rendered in the cmr8 style at 9pt. The letter has a thin, uniform stroke width and a simple, clean design.

cmr8 at 9pt

A lowercase letter 'e' from the Latin Modern font family, rendered in the cmr9 style at 9pt. The letter has a slightly thicker stroke width compared to cmr8, giving it a more substantial appearance.

cmr9 at 9pt

A lowercase letter 'e' from the Latin Modern font family, rendered in the cmr10 style at 9pt. The letter has a significantly thicker stroke width, making it appear much more robust and heavy than the previous two versions.

cmr10 at 9pt

Plans for the future: to do

- Fixing bugs and misfeatures—as soon as possible
- Reaching the basic stability of the metric data of the package—before the release of the version 1.00 (scheduled for Spring 2006, BachoT_EX)
- Adding a basic math companion (borrowed from CMs, to begin with)—timing as above
- The improvement of kerning (reluctantly), glyph shapes (redrawing all accents from scratch?), and hinting; improving OTFs by, e.g., the addition of new features—not in a hurry
- Further extensions to the character set (e.g., African languages)—after the release of the version 1.0
- More math, small caps—far future?..
